LikhKeDo — Solution Pitch

Jo bola, kya woh likha hai? ("What was said, is it in writing?") · Gnani AI Great Indian AI Internship Challenge, Nov 2026

Problem

Insurance mis-selling happens out loud. An agent says "returns guaranteed" or "sirf paanch saal premium", the English policy document says otherwise, and the buyer signs anyway. Often that buyer is an older customer who came to renew a fixed deposit. IRDAI recorded 26,667 unfair-business-practice grievances against life insurers in FY25. Buyers have no quick way to check, in their own language, whether a spoken promise is actually written in the policy.

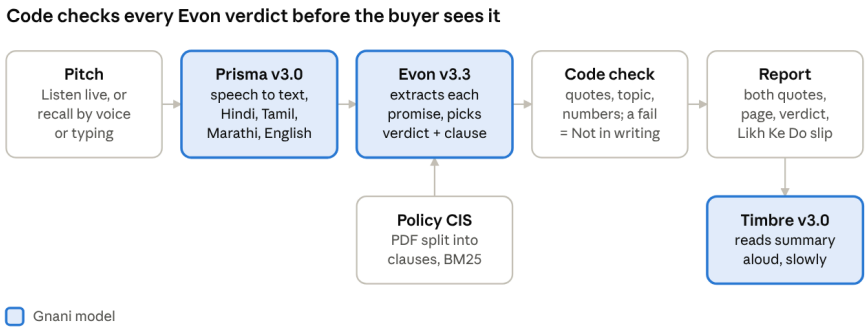

Solution

LikhKeDo ("put it in writing") checks every spoken promise against the policy's Customer Information Sheet before the buyer signs, in Hindi, Hinglish, Tamil, Marathi and English. The buyer lets it **listen** to the pitch with live captions, or **recalls** the promises afterwards by speaking or typing. The seller is never recorded. Each promise gets a verdict, with the spoken words and the exact clause and page side by side:

- **Written**: the document says the same thing.
- **Different on paper**: the document says something else.
- **Not in writing**: the document is silent, so ask for it in writing.

The buyer then hears a slow spoken summary in their language and gets a printable "Likh Ke Do" slip listing what to get in writing. Buyers who already signed see the steps to use the 30-day free-look period.

How it works

Every Gnani call goes through one rate-limited gateway, and its request id appears in the report. Built with FastAPI, SQLite, pdfplumber, rank-bm25 and rapidfuzz, plus React, Vite and Tailwind. The backend runs on Render and the frontend on Vercel.

Why it can be trusted

- **Code checks the model.** A promise must appear in what was said, and its clause quote in the cited clause (fuzzy match of 90 or more). That clause must be on the same topic, and every number in a *Written* verdict must appear in it. Any failure becomes *Not in writing*, so errors fall on the cautious side.
- **Honest labels.** Every report names the engine that produced it. *Under the hood* lists every Gnani request id. Saved demo cases carry their date. The app says "verify", never "the agent lied", and every report is marked as not financial or legal advice.
- **Privacy.** No accounts and no personal IDs. Raw audio is never written to disk, case data is deleted after 24 hours, and logs hold request ids, never text. The insurer and all voices are synthetic.

Results and limits

On a 30-promise answer key across five pitches, written before any model run and never changed, Evon scored **20/30 and 18/30** in two runs. It **never wrongly said *Written***. Prisma v3.0 kept 93–95% of pitch words, down to 5 dB babble noise and telephone-band audio.

- On a ₹0 budget, Evon ran as a community 4-bit build (IQ4_XS) on free Kaggle GPUs, not Gnani's full BF16 model. That build garbled some Hindi, so explanations and summaries are standard sentences, labelled as such. Evon still picks each promise, verdict and clause.
- *Different on paper* is the weak spot: Evon sometimes compares a promise with a related but wrong clause. That is why every card shows both quotes.
- The public site serves saved live checks, because the free GPU is not always on. Marathi is documented but not showcased.
